Study Title

International survey on current home transfusion practices

Study Description

Home transfusion programs have been implemented sporadically around the world. With the COVID-19 pandemic, there has been growing interest in expanding home transfusion. This survey is the initial step in a series of three home transfusion projects. The goal of the survey are as follows:

1. Determine how “common” the practice of home transfusion is internationally in terms of
 - a. proportion of transfusion services and
 - b. proportion of countries surveyed that provide transfusion at home
2. Identify the policies, processes, and workflows used by home transfusion programs to minimize the potential risks to patients receiving transfusions at home.
